

Date	10 March 2026
Team Project name	Streamlining Ticket Assignment For Efficient Support Operations
Team ID	SWTID-2026-1605
Maximum mark	4 Marks

SOLUTION REQUIREMENTS:

To solve the problems identified in the ticket assignment process, the proposed system aims to develop an **efficient and automated support ticket management system**. This system will streamline the process of handling customer support requests by automatically assigning tickets to the appropriate support agents based on predefined criteria such as priority, skill set, and availability. The solution is designed to improve response time, enhance operational efficiency, and provide better customer service.

The first requirement of the solution is the **ticket creation and submission feature**. Customers should be able to easily submit their issues or service requests through a user-friendly interface. The system should allow users to provide necessary details such as the problem description, category of the issue, priority level, and contact information. Once the ticket is submitted, the system should generate a unique ticket ID that can be used to track the progress of the request. This feature ensures that all customer issues are properly recorded and managed within the system.

Another important requirement is the **automated ticket assignment mechanism**. Instead of relying on manual assignment by administrators, the system should automatically allocate tickets to the most suitable support agents. The assignment process should consider several factors such as the agent's expertise, current workload, and availability. By using this approach, the system ensures that tickets are assigned efficiently and fairly among agents, reducing delays and improving the speed of problem resolution.

The system must also support **priority-based ticket handling**. Not all issues have the same level of urgency. Some tickets may involve critical system failures or urgent customer complaints that require immediate attention. Therefore, the system should categorize tickets.

The proposed system must also ensure **security and authentication**. Only authorized users should be able to access the system. Customers, support agents, and administrators should log in using secure authentication methods. Access control should be implemented so that each user can perform only the tasks relevant to their role. For example, administrators should have full access to manage the system, while customers should only be able to create and view their own tickets.

In addition, the system should provide a **simple and user-friendly interface**. The design of the system should make it easy for users to navigate and perform tasks without confusion. Clear menus, forms, and dashboards should be provided so that customers can easily submit tickets and agents can efficiently manage their assigned tasks.

Finally, the proposed solution should be **scalable and flexible**. As organizations grow, the number of users and support tickets may increase significantly. The system should be capable of handling a large number of tickets without affecting performance. It should also allow future enhancements such as integration with other business systems or advanced analytics tools.

In conclusion, the proposed solution focuses on developing an automated ticket assignment and management system that improves the efficiency of support operations. By implementing features such as automated assignment, priority handling, ticket tracking, agent management, and performance monitoring, the system can effectively address the challenges faced in traditional ticket management processes. This solution will help organizations provide faster and more reliable support services while ensuring better utilization of resources and higher levels of customer satisfaction.
